in vertebrate and invertebrate systems. This focus does not exclude the possibility of TGIP in other systems, e.g. plants (for example see Luna and Ton 2012; Henry et al. 2013). Within vertebrates and invertebrates, we address the potential mechanisms by which the phenotypic plasticity can be achieved across generational boundaries. We discuss

Invertebrate Immunity (Advances in Experimental Medicine

invertebrates constitute more than 95%, including a vast diversity of organisms from unicellular protozoans to the much more complex echinoderms and protochordates. Insects are by far the largest group of animals within the invertebrates and have received

For invertebrate virology, sequencing allowed for novel viruses, and their variants, to be discovered. Recent advances are having a significant impact on the study of viral pathogens affecting invertebrates of ecological and economic importance, as well as those that affect human health and food security and use invertebrates as vectors.

Advances in Invertebrates and Fish Telemetry - Proceedings

Aquatic invertebrates provide prey for IRES predators such as fish (Courtwright and May, 2013; Chapter 4.5) and are also consumed by terrestrial predators including insects, reptiles, birds, and mammals (Leigh et al., 2013), particularly when stranded in isolated pools or on drying channels.
