GROWTH AND YIELD OF COMMON BEAN CULTIVARS AT TWO SOIL PHOSPHORUS LEVELS UNDER BIOLOGICAL NITROGEN FIXATION 1. ADELSON PAULO ARAÃO 2, MARCELO GRANDI TEIXEIRA 3 AND DEJAIR LOPES DE ALMEIDA 3. ABSTRACT - The genotypic differences on growth and yield of common bean (*Phaseolus vulgaris* L.) in response to P supply were evaluated in a field experiment under biological N₂ fixation.

Nitrogenase is an enzyme responsible for catalyzing nitrogen fixation, which is the reduction of nitrogen (N₂) to ammonia (NH₃) and a process vital to sustaining life on Earth. There are three types of nitrogenase found in various nitrogen-fixing bacteria: molybdenum (Mo) nitrogenase, vanadium (V) nitrogenase, and iron-only (Fe) nitrogenase. ...

Introduction. Biological nitrogen fixation, the capacity to convert atmospheric dinitrogen (N₂) to a reduced form, is an ancient innovation exclusively achieved by Bacteria and Archaea and is one of the most significant ecological services that microbes offer to eukaryotes. A variety of organisms, including animals, plants, fungi and protists, form symbiotic interactions with N₂-fixing ...

Nitrogen compounds have a very long history, ammonium chloride having been known to Herodotus. They were well known by the Middle Ages. Alchemists knew nitric acid as aqua fortis (strong water), as well as other nitrogen compounds such as ammonium salts and nitrate salts. The mixture of nitric and hydrochloric acids was known as aqua regia (royal water), celebrated for its ability to dissolve ...

Nitrogen cycling in reef-building corals is a function of all holobiont members. Control of nitrogen cycling may stabilize holobiont functioning under oligotrophic and eutrophic conditions.

Biology is the study of life, past and present. The faculty of the College believe that a sound knowledge of biology is essential for understanding the world in which we live, engaging many pressing problems facing humanity, and becoming a part of their eventual solution. The Biological Sciences ...

Sink or swim: By introducing a powerful metabolic sink, more than 30 % of the fixed carbon from photosynthesis was directed toward the low-flux shikimate pathway for aromatic compound synthesis. Carbon fixation and O₂ evolution significantly increased, and a "self-remodeling" mechanism for the photosynthetic chain was demonstrated. This provides a route to aromatic compounds directly ...

The 'lampbrush' phase of extended chromosomes during meiosis has also been suggested to enable forms of genetic re-processing. In non-mammals this extended phase involves open transcription of coding and non-coding regions and has been proposed to be a form of genetic processing (Wolfe R757), which probably occurs in a less obvious way in mammals as well.

The availability and quality of water in many regions of the world are more and more threatened by overuse, misuse and pollution, and it is increasingly recognized that both are strongly influenced by forests. Moreover, climate change is altering forest's role in regulating water flows and ...
