

chapter 35 nervous system pdf

Dopamine (DA, a contraction of 3,4-dihydroxyphenethylamine) is an organic chemical of the catecholamine and phenethylamine families that plays several important roles in the brain and body. It is an amine synthesized by removing a carboxyl group from a molecule of its precursor chemical L-DOPA, which is synthesized in the brain and kidneys. Dopamine is also synthesized in plants and most animals.

â€¢ The respiratory mucosa, consisting of an epithelial layer and an areolar layer, lines the conducting portion of the respiratory system. â€¢ In the upper respiratory system, trachea and bronchi: The lamina propria,

Chapter 23: The Respiratory System

Development of the nervous system refers to the processes that generate, shape, and reshape the nervous system of animals, from the earliest stages of embryogenesis to adulthood. The field of neural development draws on both neuroscience and developmental biology to describe and provide insight into the cellular and molecular mechanisms by which complex nervous systems develop, from the ...
