

multiple regression in behavioral pdf

In statistics, linear regression is a linear approach to modelling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables). The case of one explanatory variable is called simple linear regression. For more than one explanatory variable, the process is called multiple linear regression.

Linear regression - Wikipedia

In the more general multiple regression model, there are independent variables: $y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k + \epsilon$, where y is the i -th observation on the dependent variable, x_j is the i -th observation on the j -th independent variable. If the first independent variable takes the value 1 for all i , then β_0 is called the regression intercept. The least squares parameter estimates are obtained from normal equations. The residual can be written as
